

WATER QUALITY INFORMATION

CONSUMER CONFIDENCE REPORT

ISSUED
JUNE 2015
SADDLE RIVER WATER UTILITY

Dear Customer,

We regularly test the water to be sure that your water meets the safety standards. All the test results are on file with the New Jersey Department of Environmental Protection (NJDEP), the agency that monitors and regulates drinking water quality in our state. The United States Environmental Protection Agency (EPA) and the NJDEP establish these regulations. They also require water suppliers to provide an annual Consumer Confidence Report (CCR) for their customers.

This CCR provides important information about your drinking water. Please read it carefully and feel free to call the Borough of Saddle River at 201.327.2609 if you have any questions about your water or your water service. Or, you can call the EPA Safe Drinking Water Hotline at 800.426.4791. If you have specific questions about water as it relates to your personal health, we suggest that you contact your health care provider.

Sincerely,

A handwritten signature in black ink, appearing to read 'Laurent Carrot', written over a white background.

Laurent Carrot
Vice President & General Manager

Who We Are

United Water is one of the nation's leading environmental companies, providing water and wastewater services to approximately 5.3 million people in the United States. In addition to owning and operating 16 water and wastewater utilities, United Water operates 84 municipal and industrial water and wastewater systems through innovative public-private partnerships and contract agreements. Founded in 1869, United Water is a subsidiary of SUEZ ENVIRONNEMENT.

United Water New Jersey provides an average of 108.114 million gallons of water per day to customers in the Bergen and Hudson Counties.

About Your Water Supply

Customers receive their water primarily from four United Water reservoirs. These sources are Oradell, Lake Tappan and Woodcliff Lake reservoirs in Bergen County, New Jersey and Lake DeForest reservoir in Rockland County, New York. The Oradell, Lake Tappan and Lake DeForest reservoirs are located on the upper or freshwater portion of the Hackensack River. Woodcliff Lake reservoir is located on the Pascack Brook. We also operate wells throughout our service territory which supplement our supply. In addition, we are partners with the North Jersey District Water Supply Commission in the Wanaque South Project. This is a regional network of pipelines, pumping stations and reservoirs that can provide up to 60 million gallons of water per day to our customers. To further ensure the safety of your water, we monitor it before, during and after the treatment process.

Saddle River Water Utility

Saddle River Water Utility is a private utility that is based on a contract operation with United Water. This contract began on July 1998 and established that United Water would operate the system and be the sole water purveyor. Saddle River Water Utility serves approximately 110 customers.

Tap Water or Bottled Water?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA Safe Drinking Water Hotline at 800.426.4791.

The sources of drinking water (for both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals, and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that the water is safe to drink, the EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health. So, what's the bottom line? If bottled and tap water meet the federal standards, they are both safe to drink. However, your tap water is substantially less expensive than bottled water.

Drinking Water Quality

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infections by cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 800.426.4791. The table below shows how the quality of your drinking water in 2014 compared to the standards set by the NJDEP.

Primary Standards

Directly related to the safety of drinking water.

Inorganic Chemicals	MCLG	MCL	Highest* Result	Range of Results	Violation	Likely Source
Barium ppm	2	2	0.14	0.06 - 0.14	No	Erosion of natural deposits; discharge of drilling wastes; discharge from metal refineries
Chromium ppb	100	100	3.2	ND - 3.2	No	Erosion of natural deposits; discharge from steel and pulp mills
Nitrate as nitrogen ppm	10	10	3.41	0.07 - 3.41	No	Runoff from fertilizer use; leaching from septic tanks, sewage; Erosion of natural deposits

Copper and Lead (2013)	MCLG	AL	90th Percentile	Samples > AL	Violation	Likely Source
Copper ppm	1.3	1.3	0.19	0	No	Corrosion of household plumbing
Lead ppb	0	15	7.2	0	No	Corrosion of household plumbing; erosion of natural deposits

Disinfection by-products - Stage 2	MCLG	MCL	Highest Result	Range of Results	Violation	Likely Source
HAA5 ppb	NA	60	16.7	NA	No	By-product of drinking water disinfection
Total THMs ppb	NA	80	40.7	NA	No	By-product of drinking water disinfection

Note: Only one THM and one HAA5 required annually. The Stage 2 compliance result is based on the one annual sample.

Disinfectant Residual	MRDLG	MRDL	Highest Result RAA	Range of Results**	Violation	Likely Source
Chlorine/Chloramines ppm	4	4.0	3.15	2.39 - 3.71	No	Treatment process

Note: Disinfectant Residual range of results are site specific.

Inorganic Disinfection by-products	MCLG	MCL	Highest Result RAA	Range of Results**	Violation	Likely Source
Bromate ppb	0	10	2.3	1.5 - 3.7	No	By-product of drinking water disinfection

Note: Range of Results are site specific.

Radionuclides	MCLG	MCL	Highest Result RAA	Range of Results	Violation	Likely Source
Uranium ppb	0	30	2	ND - 2	No	Erosion of natural deposit

Turbidity	MCLG	MCL	Level Found	Range of Detections	Violation	Likely Source
Turbidity NTU [^] (value plant)	NA	TT=1NTU TT=95% <0.3NTU	0.18 100.0%	0.02 - 0.18 NA	No	Soil run-off

[^]Turbidity is a measure of cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of our filtration system.

TOC Removal Ratio	MCLG	MCL	Lowest Ratio (RAA)	Range of Ratio (Monthly Ratio)	Violation	Likely Source
TOC Removal Ratio (RAA)	NA	TT, TOC Removal ratio >1	1.04	0.95 - 1.22	No	Naturally present in the environment

RAA=Running Annual Average

*Highest results are based upon the highest single sample.

**The "Range of Results" represent the lowest and highest detection at the individual sampling sites during the monitoring year.

Secondary Standards

Related to the aesthetic quality of drinking water.

Substance	NJ RUL	Highest Result*	Range of Results	Likely Source
Alkalinity ppm	NA	200	71 - 200	Natural Mineral
Aluminum ppb	200	110	ND - 110	Treatment process
Calcium ppm	NA	78	27 - 78	Natural Mineral
Chloride ppm^A	250	281	74 - 281	Natural mineral, road salt
Color CU	10	4	3 - 4	Natural mineral and organic matter
Hardness (as CaCO3) ppm^A	250	292	104 - 292	Natural mineral
Iron ppb	300	58	ND - 58	Erosion of natural deposits and oxidation of iron components
Odor TON	3	3C	ND - 3C	Naturally occurring, chlorine
pH	6.5-8.5	8.33	7.79 - 8.33	Natural mineral, treatment process
Sodium ppm#	50	76	46 - 191	Natural mineral, road salt
Specific Conductance, umhos	NA	1211	426 - 1211	Natural Mineral
Sulfate ppm	250	17	12 - 17	Natural mineral
Total Dissolved Solids ppm^A	500	626	227 - 626	Natural mineral

^ Note on exceedences: Secondary standards are non-mandatory guidelines to assist public water systems in managing their drinking water for aesthetic considerations, such as taste, color and odor. These contaminants are not considered to present a risk to human health.

* Highest results are based upon the highest single sample.

United Water was above New Jersey's RUL for sodium. For healthy individuals, the sodium intake from water is not important because a much greater intake of sodium takes place from salt in the diet. However, sodium levels above the RUL may be of concern to individuals on a sodium restricted diet. The "Average Result" and "Highest Result" are based on the Running Annual Average (RAA), due to multiple samples collected for Sodium during 2014. Please see additional sodium information on page 6.

Unregulated Substances

For which the EPA requires monitoring.

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist the EPA and DEP in determining the occurrence of unregulated contaminants in drinking water and whether regulation is warranted.

Substance	MCLG	MCL	Highest* Result	Range of Results	Violation	Likely Source
Chromium ppb	NA	NA	0.5	ND - 0.5		Prevalent natural element
Strontium ppb	NA	NA	170	110 - 170		Naturally occurring element
Vanadium ppb	NA	NA	0.4	ND - 0.4		Naturally occurring element
1,4-Dioxane ppb	NA	NA	0.07	ND - 0.07		Used as a solvent, cleaning agent, chemical stabilizer, surface coating, adhesive agent, and an ingredient in chemical manufacture
Chlorate ppb	NA	NA	300	110 - 300		Known by-product of the drinking water disinfection process, forming when sodium hypochlorite or chlorine dioxide are used in the disinfection process
Chromium(VI) ppb	NA	NA	0.33	0.03 - 0.33		Industries that process or use chromium, chromium compounds, or chromium processes

Additional information about unregulated contaminants can be found at the following link, courtesy of American Water Works Association:
<http://www.drinktap.org/home/water-information/water-quality/ucmr3.aspx>

Definitions

Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

CU: Color unit.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectant to control microbial contamination.

NA: Not applicable.

ND: Not detected.

NJ RUL: New Jersey Recommended Upper Limit

NTU: Nephelometric Turbidity Unit.

ppb Parts per billion: The equivalent of one second in 32 years.

ppm Parts per million: The equivalent of one second in 12 days

pCi/L Picocuries per liter: The equivalent of one second in 32 million years.

Primary Standards: Federal drinking water regulations for substances that are health-related. Water suppliers must meet all primary drinking water standards.

Secondary Standards: Federal drinking water measurements for substances that do not have an impact on health. These reflect aesthetic qualities such as taste, odor and appearance. Secondary standards are recommendations, not mandates.

TON: Threshold Odor Number.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Sodium and Your Drinking Water

United Water routinely monitors the drinking water to ensure that it meets the standards set by the United States Environmental Protection Agency (EPA) and the New Jersey Division of Environmental Protection (DEP). While the EPA does not have a maximum level for sodium in drinking water, the NJDEP has a recommended upper limit (RUL) of 50 parts per million (ppm).

2014 test results show that United Water exceeded the recommended upper limit for sodium. The highest running annual averages at the Haworth Water Treatment Plant and the Upper Saddle River wells were 76 ppm and 69 ppm, respectively, with a range of results of 46 ppm to 191 ppm. The highest running annual average at the Wyandotte Well/High Mountain Well in the Franklin Lakes System was 49 ppm, with a range of results of 44 ppm to 63 ppm.

The first two months of 2015 test results show that United Water exceeded the recommended upper limit for sodium, with a range of results of 57 ppm to 107 ppm.

According to the DEP, for healthy individuals, the sodium intake from water is not important because a much greater intake of sodium takes place from salt in the diet. However, elevated levels of sodium may be a concern for persons on a sodium restricted diet. If you have any concerns, please consult your health care provider.

Road salt run-off affecting our source water quality is the leading cause of elevated sodium levels in the drinking water supply. We are meeting with communities within our source water area to discuss options for minimizing use of and/or alternatives to road salt.

For more information, please call 1.800.422.5987.

State Water System ID#: 0238001

(Haworth Plant and Upper Saddle River Wells)

State Water System ID#: 0220001 (Franklin Lakes System)

Lead And Your Drinking Water

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Your water is lead free when it leaves our treatment plant. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Saddle River Water Utility is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 second to 2 minutes before using water for drinking and cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water hotline or at <http://www.epa.gov/safewater/lead>.

About the Treatment Process

At United Water, our goal is to provide you with drinking water that meets or surpasses all federal and state standards. Our water treatment plant in Haworth, New Jersey, uses ozone, a form of oxygen, to purify your water and high-rate dissolved air flotation (DAF) for sedimentation clarification. State-of-the-art DAF technology facilitates improved water quality, enhanced service reliability, reduced chemical and energy usage, and the protection of sensitive ecosystems. Water treated at the plant is also filtered and contains a small amount of chloramine — a combination of chlorine and ammonia — to help ensure the safety of your water. The water you receive from wells or interconnections with other water suppliers is purified with chlorine. To further ensure the safety of your water, we monitor it before, during and after the treatment process.

For example, we routinely test the water at the rivers, lakes, streams and wells that supply drinking water. We also sample and test treated water directly from the distribution system in each community we serve. As you can see, we are committed to providing you with top quality water.

Important Information

Source Water Assessment Program

The New Jersey Department of Environmental Protection (NJDEP) has completed and issued the Source Water Assessment Report and Summary for this public water system, which is available at <http://www.state.nj.us/dep/swap> or by contacting the NJDEP, Bureau of Safe Drinking Water at 609.292.5550.

Saddle River Water Utility obtains its drinking water entirely from United Water New Jersey; therefore, susceptibility ratings for each individual source for each of the contaminant categories are not available for this system. For susceptibility ratings of purchased water, refer to the specific water system's source water assessment report found at the above web site address. United Water New Jersey's Public Water Supply System Identification Number (PWID) is 0238001. NJDEP considered all surface water highly susceptible to pathogens, therefore all intakes received a high rating for the pathogen category. For the purpose of the Source Water Assessment Program, radionuclides are more of a concern for ground water than surface water. As a result, surface water intakes' susceptibility to radionuclides was not determined and they all received a low rating. **If a system is rated highly susceptible for a contaminant category, it does not mean a customer is or will be consuming contaminated drinking water. The rating reflects the potential for contamination of source water, not the existence of contamination.** Public water systems are required to monitor for regulated contaminants and to install treatment if any contaminants are detected at frequencies and concentrations above allowable levels. As a result of the assessments, NJDEP may customize (change existing) monitoring schedules based on the susceptibility ratings.

If you have questions regarding the source water assessment report or summary please contact the Bureau of Safe Drinking Water at watersupply@dep.state.nj.us or 609.292.5550.

Susceptibility Rating for United Water New Jersey Water Sources

EPTDS Number	Source ID	Source Name	Pathogens Rating	Nutrients Rating	Pesticides Rating	VOCs Rating	Inorganics Rating	Radionuclides Rating	Radon Rating	DBPs Rating

Definitions

Pathogens: Disease-causing organisms such as bacteria and viruses. Common sources are animal and human fecal wastes.

Nutrients: Compounds, minerals and elements that aid growth, that are both naturally occurring and man-made. Examples include nitrogen and phosphorus.

Volatile Organic Compounds (VOCs): Man-made chemicals used as solvents, degreasers, and gasoline components. Examples include benzene, methyl tertiary butyl ether (MTBE), and vinyl chloride.

Pesticides: Man-made chemicals used to control pests, weeds and fungus. Common sources include land application and manufacturing centers of pesticides. Examples include herbicides such as atrazine, and insecticides such as chlordane.

Inorganics: Mineral-based compounds that are both naturally occurring and man-made. Examples include arsenic, asbestos, copper, lead, and nitrate.

Radionuclides: Radioactive substances that are both naturally occurring and man-made. Examples include radium and uranium.

Radon: Colorless, odorless, cancer-causing gas that occurs naturally in the environment.

Disinfection Byproduct Precursors (DBPs): A common source is naturally occurring organic matter in surface water. Disinfection byproducts are formed when the disinfectants (usually chlorine) used to kill pathogens react with dissolved organic material (for example leaves) present in surface water.

L, M, H: Low, Medium, High, susceptibility

P: Pumped into surface supply.

U: Not in Use/Out of Service

For more information on radon go to:
<http://www.nj.gov/dep/rpp/radon/index.htm> or
 call 800.648.0394.

Waiver Information

The Safe Drinking Water Act (SDWA) regulations allow monitoring waivers to reduce or eliminate the monitoring requirements for asbestos, volatile organic chemicals (VOCs) and synthetic organic chemicals (SOCs). Our system received monitoring waivers for SOCs. We have a synthetic organic chemical (SOC) waiver because we are not vulnerable to this type of contamination.

This report contains important information about your drinking water.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Conservation Tips

Fresh, clean drinking water is a necessity so there is never enough to waste. Remember, a little effort and a little common sense will make a big difference. It is essential for us to take water saving steps now. We encourage our customers to use water wisely—even when supplies are abundant.

At United Water, we offer the following conservation tips for saving water. Inside your home, never use your toilet as a wastebasket, take shorter showers or take a shallow bath instead of a shower. Turn off the tap while brushing your teeth or shaving; while waiting for hot water from the tap, catch the flow in a watering can and use it for watering house or garden plants. Keep a bottle of tap water in the refrigerator instead of running the faucet for cold water, wash vegetables and fruit in a basin and use a vegetable brush to remove dirt. Run your dishwasher and washing machine only when full. By following these tips, you can save hundreds of gallons of water a day.

Aquariums and Your Water

While chlorine in the water is perfectly harmless to humans—it helps assure your water is safe—it's not good for your fish. Because we add chlorine to our water, you need to dechlorinate it before you add it to your aquarium. Your local pet store can tell you about the easy steps you should take to keep your fish safe and healthy.
